It gives me great pleasure to transmit to you the fifth annual **Residential Property Survey**. In it you will find a variety of comparative information about Alberta's municipalities and their taxation of residential properties. This information is designed to help municipal decision makers in monitoring their organization's performance.

The data in this year's survey has been developed primarily from information already provided to Alberta Municipal Affairs by municipalities through the filing of their **1988 Annual Financial Reports** and population affidavits. Additional information on utilities charges, the use of special levies on residential properties and the mix of housing was collected in a 1989 survey of all urban municipalities. For their assistance, we acknowledge the help of the municipal administrations.

It is urged that care should be taken when making intermunicipal comparisons of taxation levels. Clearly urban municipalities should not compare themselves to rurals; neither should communities of significantly different population levels be compared.

Unreliable comparisons can be minimized by working through the three steps in the User's Guide to select appropriate municipalities for comparisons.

A point to remember is that the data presented in this Survey is primarily drawn from the 1988 Alberta Municipal Finance Information System Financial Reports. Municipal finance is very dynamic and before you draw major conclusions from the survey you should ask yourself how conditions may have changed during the intervening year. Every municipal council in Alberta has the power to make decisions about the level of services, and this will affect any data.

As always, I welcome your comments and suggestions for improvements on this survey and its value to your work.

John McGowan, Executive Director
Municipal Services Branch
Alberta Municipal Affairs

THE USER'S GUIDE TO THE RESIDENTIAL PROPERTY SURVEY

1. Introduction

This report has been developed to enable you to make meaningful comparisons of residential property assessment, taxation and utility charges. However, assumptions need to be made in order to make comparisons with the data and among municipalities. This **"User's Guide"** and the **"Introductions"** for each table direct your attention to some of the factors which cause variability in the data. In turn, you are better able to attach confidence to your comparisons.

The contents of this report are structured as follows:

USER'S GUIDE:

You will want to know the general rules and assumptions about the data being reported. This overall introduction is found in the User's Guide.

TABLE I:

To be able to tap into the wealth of the data in this survey, you are asked to begin by choosing comparable municipalities for your analysis. To do this you are guided through three steps. Table I helps you select municipalities which will be similar in population size, their housing stock and strength of their property tax base. These communities are the ones that will be most comparable to your municipality.

TABLE II:

Once you have selected several comparable municipalities using Table I, information on the level of taxation, utilities charges and special levies made per dwelling unit is found in Table II. You are provided with information about the proportion of the residential property tax which is used for municipal purposes, supplementary school requisitions and for other requisitioning authorities (such as the Provincial Planning Fund, Hospital Districts, Seniors Foundations). A measure of the burden of taxation is presented in an indicator using Total Property Taxation per Dwelling Unit as a percentage of Median Household Income.

TABLE III:

This Table provides you with information on the strength of the municipality's property tax base. Equalized assessment is the fundamental measure you can use for the comparisons. The strength of the non-residential tax base is an important measure because this will condition the load placed upon your residential taxpayers. The growth of equalized assessment base and changes in its composition over the last two years are identified so that you can have a perspective on changing economic conditions in the municipality. Table III also provides you with a number of measures of how heavily the tax base is being used by the municipality by expressing municipal, school and other taxation as mill rates on the equalized assessment base.

TABLE IV:

Municipalities raise a significant part of their revenues through other charges levied against residential property. Table IV details for you the charges levied for water, sewer and solid waste disposal services in all urban municipalities. These utilities often represent a major component of municipal expenditures and debt. This data allows you to

make intermunicipal comparisons of net costs and debt for these services.

In short, the layout of this report encourages you to use comparable municipalities as a means to identify and explain variations in taxation and utility charges. Recognizing the differences between municipalities ensures you will be conducting meaningful comparisons with neighboring municipalities.

2. Presentation of Data

The data in the tables has been largely taken from the **1988 AMFIS.** Some 1989 data is from the Population Affidavit, the Utilities Survey and from the Equalized Assessment Board. Equalized Assessment data for 1989 is used because this information is prepared from the earlier years municipal live assessment roles. In this way, equalized mill rates are more consistent. Any other data sources used are noted in the introduction for each Table. However, AMFIS data is not available for the City of Lloydminster. Where comparable data exists, it was submitted by the City.

As you will see, this report consists largely of data. The use of consistent presentation techniques helps to make your comparisons easier. Urban municipalities are arranged by population, and each municipal type (eg. Towns) has been divided into groups of about 30 municipalities. At the bottom of each page you will see **two averages.** The **first average** is for the group of municipalities found on that page. The **second average** is for all municipalities of the same "status" (eg. all the Towns). **All averages are "column averages".**

For towns, villages and summer villages, these page groupings are particularly convenient for municipalities located around the middle of each page. You should look above and below to find comparable municipalities. Those municipalities near the bottom or the top of the pages perhaps should be compared with municipalities on subsequent or previous pages.

Another "user friendly" feature in the introduction of each table is an illustrated **User's Note**. As a quick reference, a summary of the data by municipal types is presented. These notes also help you to use the data and detail how these statistics are calculated.

3. Steps to Comparability

Selecting appropriate municipalities to compare your municipality to is the most important step you can take to making good use of this data. Four steps to selecting comparable municipalities are presented in the Introduction to TABLE I. You are urged to work through these steps.

4. School Jurisdictions

The Supplementary School Requisitions data represents an aggregate of all the supplementary requisitions levied by all the school jurisdictions operating within the municipal boundaries. As such this measure can not be directly attributed to a single school authority. A code to identify the **dominant school jurisdiction** in the municipality is noted on

a prefix - from 1 to 6 - before the decimal point. These numbers refer to the Alberta Education Zone. The first digit after the decimal point indicates the status of the school authority as follows:

1. School Division
2. County
3. Public School District
4. R.C. Separate School District
5. Consolidated School District
6. R.C. Public School District
7. Protestant Separate School District
8. Regional School District

The remaining three digits identify the specific jurisdiction under each status group heading. These three digits are complemented by a recognizable number.

Examples:

5.3030 Zone 5: Calgary (Public) School District No. 19.
3.2190 Zone 3: County of Strathcona No. 20.

More detailed information on each School Authority is provided in the Appendices.

5. Utility Rates Survey

The data featured in Table IV is from a survey of all Cities, Towns and Villages conducted in the fall of 1989. These municipalities were provided with their reported 1988 annual utilities charges for a standard volume of water, sewer and solid waste disposal service. In turn, they reported back any changes made to these charges in 1989. The survey obtained a 100% response rate. Additional information was collected concerning the mix of housing types and the application of Special Levies and Local Improvements charges on residential land uses .

6. Technical Notes and Abbreviations

The following notes help clarify some of the data in the tables and assist you in interpretation. Listed below are considerations which apply generally to several tables and statistical data.

Averaging: The urban municipalities are listed by status (ie. City, Town etc.) and in order of population size (ie. highest to lowest). The rural municipalities are arranged by status and in order of the percentage of the housing stock which is farm dwellings (ie. highest to lowest). Summer Villages are arranged in the order of number of lots with dwellings (ie. highest to lowest). Each page has about 30 municipalities which are considered a group. A column average is calculated for each page. An overall average is also reported which means the average of all municipalities of the same status (for example, all towns). In all cases, the average is calculated only for the municipalities reporting data.

Blank spaces, 0 or n/a in the tables: A blank space implies that no data was provided through a survey. A zero (0) indicates that (0) was the reported value (eg. level of charges for solid waste disposal). A "n/a" implies that this measure was not calculated because of lack of data.

Dollar amounts: All dollar amounts refer to 1988 nominal or current dollars as reported by the municipality. The exceptions are utility charges which were reported in 1989 and the Median Income data which is derived from 1987 income tax data.

Standard measure and conversions: Metric is the stan-

dard unit of measure found in this report. The following are conversion factors into the Imperial measure for area and volume:

one hectare (ha) = 2.47 acres or 10,000 square meters
one acre (ac) = 0.4 hectares
one meter = 3.281 feet
one foot = 0.305 meters
one square meter (sq. m) = 10.764 square feet
one square foot = 0.093 square meters
one cubic meter (cu. m) = 220 gallons
1000 gallons = 4.55 cubic meters

All of the above conversions are approximates.

Abbreviations and Short Forms: Both are found throughout this report. Refer to the introductions of each Part and the Appendices for an explanation of the abbreviations and short forms found in the tables.

Any and all suggestions, comments or other queries relating to the survey should be directed to:

TABLE I: BASES FOR COMPARISON

TABLE I: BASES FOR COMPARISON

Introduction

The information in this Table will help you select similar communities for comparison. **Population, housing stock and fiscal capacity are measures to consider when selecting similar communities for comparisons.**

The population data reported is for 1989, and the 1988 to 1989 rate of population growth is provided. It should be recognized that municipalities are not required to conduct an annual census. Consequently, a growth rate of 0% likely means that no census was conducted.

The dwelling unit data is for 1988. Throughout this report your are provided with sets of information using **"per dwelling unit"** statistics. This necessarily adds some uncertainty to comparisons since an "average dwelling" will differ among urban municipalities. The size, age, value and mix of housing types will all affect assessment and this will influence the level of taxation.

In rural areas, finding comparable municipalities is more difficult. The housing picture is complicated by the fact that there is often housing in hamlets, on country residential acreages and on farms. Combined, these make the per dwelling measures more subject to variation. It was observed that there was a closer relationship among municipalities with a similar proportion of farms than between municipalities with a similar sized population. Accordingly, for rural municipalities the data was ordered by proportion of total dwellings which are farms.

By completing the following steps you can select similar municipalities which in turn will increase confidence in your comparisons.

STEP 1. First consider whether the **population and growth rate** of the municipalities that you want to make comparisons with are similar. It is difficult to compare municipalities of different population sizes, even if they are adjacent. Also, the geographic location of the municipality will sometimes affect taxation levels For rural municipalities you will want to refer to Appendix 1 and to consider the additional data on density and area. For Summer Villages population is not a valid statistic. Comparisons should consider the number of parcels with dwellings (Column 3 of Table I).

STEP 2. Secondly, for urban municipalities you should examine the **comparability of the housing stock**. Is the mix of Single Family Dwellings, Mobile Homes and Multiple Family Dwelling Units about the same? If they are also check that the **Residential Equalized Assessment per Dwelling Unit** is similar. Then it is likely that your selected urban municipalities will be providing fairly similar services to their residential properties. As a result you can now draw more reliable conclusions about your comparisons of taxation and charges.

In the third column 1988 Residential Equalized Assessment per Dwelling Unit (R.E.A.P.D.U.). is calculated. The R.E.A.P.D.U. measure uses the portion of total equalized assessment which is not subject to the School Foundation Program Fund Levy. This measure has potential as an indicator of the average quality of the residential development in a municipality. It can generally be observed that the higher this number is, the better is the average quality of residential

development in the community and/or the higher is the proportion of single family housing in the total housing mix.

For Summer Villages we use "parcels with residences" as a proxy for dwelling units.

For selecting rural municipalities you will want to refer to Appendix 1. There you are provided with additional data on "farm" and "non-farm" dwelling units.

STEP 3. Third, do the municipalities have a **comparable tax base** which gives council the opportunity to raise funds? Measures of **"fiscal capacity"** include Equalized Assessment per Capita, Equalized Assessment per Dwelling and, for Rural Municipalities, Equalized Assessment per Kilometer of Road Serviced. Fiscal capacity statistics furnish the best readily available indicators of the relative ability of any given municipality to provide a standard "basket" of municipal goods and services, for any given standard level of taxation.

Equalized Assessment per Capita (E.A.P.C) and Equalized Assessment per Dwelling Unit (E.A.P.D.U.) measures relate the amount of assessment to the population and the number of dwelling units - the major sources of demand for services in virtually all municipal settings. It should be noted that these measures have been calculated for Summer Villages based upon the number of parcels with residences. The net costs involved ultimately require taxation which has to be raised from the municipality's assessment base. This base may consist of varying proportions of commercial, industrial and institutional property as well as the predominant residential (and farmland) property. The larger the assessment base overall, and the greater the non-residential portion, the more likely it is that the residents will pay average or below average taxes. This could mean comparatively low levels of taxes, or better service levels.

STEP 4: Fourth, do the municipalities that you are comparing have **similar types of taxes and charges**? This year Total Property Tax per Dwelling is directly comparable across all urban and all rural municipalities. When examining Total Aggregate Costs, you should be comparing only those municipalities which levy similar types of taxes and charges. Comparable municipalities should either all have, or not have, special levies and/or utility charges.

The comparability of taxation levels in a municipality may be influenced by any one or more of the following factors:

i) the currency of the property assessment value, and/or

ii) the range of municipal services supported by taxes;

ii) the level at which these services are provided

iv) the method of service-delivery, (eg. volunteers/ com munity associations, or full-time municipal staff; private contractors or municipal staff);

iv) the financing approach, (eg. general benefit versus property-owner benefit, and the associated tax burden; or pay-as-you-go capital works financing versus deben turing).

v) the presence or absence of special assessments and local improvements, (eg. special municipal levies) and/ or

vi) the incidence of extraordinary or other special requisitions, (eg. by a hospital district authority).

The general fiscal policies of a municipality also may have a significant bearing on the level of taxation. No attempt has been made to gauge service-profile/financing strategies. However, its importance should be borne in mind when making comparisons between municipalities.

TABLE I: BASES FOR COMPARISON

USER'S GUIDE AND TECHNICAL NOTES

Basic Comparisons: Comparable municipalities are those of similar population size, housing mix and residential equalized assessment per dwelling. Generallly you would expect municipalities of a similar six to have a similar housing mix and fiscal capacity.

A population growth rate of 0% likely means that no census was conducted.

Residential Equalized Assessment per dwelling is an indicator of comparative values of the housing stock.

These property tax base indicators show the relative ability of a municipality to provide a standard basket of goods/services for a standard level of taxes.

The higher the Equalized Assessment per capita, per dwelling and, in rural municipalities, per kilomenter of road, the better off is the average residential taxpayer.

For explanation of the School Jurisdiction code refer to the User's Guide in this report.

	STEP 1 Municipal Size		STEP 2 Housing Stock					STEP 3 Fiscal Capacity			
Municipality	Population 1989	Population Growth Rate 1988-1989	Number of Dwellings 1988	Residential Eq.Assess. Alberta Municipal Affairs (October 1989)

Urban Municipalities are listed by decreasing population. Rural sorted by the proportion of farms to the total number of dwelling units.

From AMFIS

Refers to that portion of the Total Equalized Assessment in a municipality that is not subject to School Foundation Program Fund levy divided by the number of dwellings.

Data collected on urban municipalities by survey in Fall 1989. Multiple family dwellings includes all dwellings which are not Single Family or Mobile Home units.

Housing Mix may not add to 100% due to rounding.

Fiscal Capacity measures are calculated by dividing Total Equalized Assessment by Total Population, Dwellings (Parcel with Residences in Summer Villages) and, for rural municipalities, Kilometers of Roads serviced. These are all measures of the comparative strength of the municipal tax base.

TABLE II: TAXATION AND CHARGES ON RESIDENTIAL PROPERTIES

TABLE II: TAXATION AND CHARGES ON RESIDENTIAL PROPERTIES

Introduction

You are provided an overall picture of the comparative levels of property taxation, utilities charges and Special Levies and Local Improvements made against residential properties in all Alberta municipalities.

Featured in Table II are the **Total Property Taxes per Dwelling** (T.P.T./D.U.). Total Property Taxes per Dwelling Unit includes general municipal taxes, all school requisition taxation and the taxes necessary to cover other requisitions such as those for planning, hospitals and nursing homes divided by the total number of dwellings in the municipality. This measure has been altered from the previous years studies by removing money collected from Special Levies and Local Improvements.

By their nature, Special Levies are not applied universally but rather are assigned on specific areas within the municipality. The disaggregation of this measure will allow you to make comparisons of basic levels of taxation with more confidence.

For rural municipalities, revenues from farm taxation are also included in T.P.T. because of the difficulty in differentiating between farm and non-farm dwellings from the available information. Accordingly, no comparison should be made between a rural municipality and an urban municipality for this basic measure.

In summer villages, the revenues are the same as for urban municipalities but the average is calculated based upon the number of "occupied parcels" rather than the number of dwelling units.

The **TPT/DU Index** indicates the level of taxation of residential units for each municipality relative to the group average. As such, the index value only relates to information for an "average" dwelling unit. There will be significant variation among dwellings of different types and sizes depending upon their assessed values. This measure does not consider taxation of non-residential uses such as industrial or commercial property.

The **distribution of the Property Taxes** levied on Single Family Residential Properties is provided in three columns. The percentage of taxes used for municipal purposes, supplementary school requisitions and for other requisitioning authorities are noted. These measures are derived from mill rates levied on single family residential property. There may be some variation in this distribution if mill rates for multiple family residential housing were considered. However, for most municipalities, single family housing is the dominant use and thus the distribution of taxes for this use can be considered generally applicable to all types of housing.

Municipalities levy charges on users for a number of services. Most directly applicable to residential property are **charges for municipal utilities** like water, sewer and solid waste disposal. The total of these charges is presented in this table as a component of Total Aggregate Cost. The detailed information on these services is provided later in Table IV.

Municipalities also use **Special Levies and Local Improvements** to generate revenues. Information was obtained on the total amount collected from residential properties and how many dwellings paid such levies. This was a difficult task and many municipalities were unable to provide this data. However, for those who could, the average levy per dwelling paying Special Levies and Local Improvements is identified. The extent of the use of these charges is indicated by the proportion of the total dwellings in the municipality which were paying this charge.

Total Aggregate Costs per Dwelling Unit (T.A.C./D.U.) are the sum of total property taxes per dwelling unit (T.P.T./D.U.), total utility charges (T.U.C./D.U.) and special levies and local improvements. You may wish to consider whether to include, or not to include, the special levies and local improvements when making comparisons with other municipalities. For quick comparisons a **T.A.C. Index** has been included.

A question always of concern to councils and administrations is the **"ability of the taxpayers to pay"** for existing or proposed services. One such statistic is the "Household Median Income" (H.M.I.) which has been derived from Statistics Canada data. The H.M.I. is compiled from 1987 personal income taxation information as filed by postal code areas. You should note that postal code areas do not necessarily have the same boundaries as the municipality. As a result the income figures, particularly in the smaller communities, can be affected by the number of rural residents who are served from postal stations in a nearby urban centre.

The Household Median Income refers to the median income of all tax filers reporting income in each urban municipality multiplied by 1.6 taxfilers per dwelling unit. This measure has been indexed to provide you with a quick measure of "ability to pay" among municipalities.

For the rurals, no municipality-wide median income was reported. However, an estimate has been computed based on the published data for small areas within each rural municipality. As a result, the income based measures should be used with some caution for the rural municipalities.

The Total Property Tax per Dwelling Unit (T.P.T./D.U.) has been expressed as a percentage of the Household Median Income (H.M.I.). Relatively high or low percentages may provide you with an answer to the degree of flexibility that the Council may wish to exercise in taxing. The index of this measure indicates how far each municipality diverges from the average. You should know that in those municipalities with a small population the reliability of these measures decreases because of the influence of rural taxfilers who file in small communities and the statistical rounding practices of Statistics Canada. These factors can significantly alter the median income.

TABLE II: TAXATION AND CHARGES ON RESIDENTIAL PROPERTY

USER'S GUIDE AND TECHNICAL NOTES

Compare Total Property Tax per Dwelling Unit using the $ amounts or the index relative to the group averages at the bottom of the page.

The split of T.P.T. demonstrates the relative demands on the residential property tax base by the various requisitioning authorities. You can compare demand that all these authourities place on the tax base, as well as each one relative to a municipality and to the averages at the bottom of each page.

Compare the Total Aggregate Cost and the Index to other municipalities which levy the same charges to appreciate the total amount of taxes and charges on residential property.

Use Household Median Income as a measure of taxpayer wealth and ability to pay for services.

Use Total Property Tax as a percentage of Household Median Income to indicate the burden of taxation on the local taxpayer.

	Property tax		Use of Property Tax			Other Charges			Total Taxes and Charges		Burden of Taxation and Charges

Includes residential taxes and mobile home license fees (as well as farmland taxes in the case of rural municipalities); divided by the number of dwellings. In summer villages , the average is calculated for the number of occupied lots rather than for dwelling units.

The splits of T.P.T. are calculated using the proportion of total mills levied on single family residential properties by each requisitioning authority. The school mill rate is the mills needed to collect the supplementary requisition.
The sum of annual charges for water, sewer and solid waste disposal services. For detail see Table IV.

Total special levies plus local improvement charges collected from residential properties were divided by the number of dwellings assessed these charges. The proportion of the total housing stock paying these charges is calculated by dividing the number of houses paying the charges by the total housing stock.

Annual total property tax per dwelling plus utility charges and, in urban municipalities where applied, the average residential special levies and local improvements per dwelling levied.

Calculated from 1987 median taxable income data compiled by postal zone by Statistics Canada; multiplied by 1.6, which is the average number of people filing tax returns per dwelling in Alberta. This information is not available for Summer Villages.

Total property tax per dwelling as a percentage

TABLE III: THE EQUALIZED ASSESSMENT BASE AND ITS USE

TABLE III THE EQUALIZED ASSESSMENT BASE AND ITS USE

Introduction

The composition and size of the municipal property tax base affect the ability of the municipal council to raise taxes. This table is designed for you to **compare municipal tax bases and how they were used in 1988**. The statistics presented employ 1988 financial statement data derived from the Alberta Municipal Financial Information System (AMFIS) and 1989 equalized assessments (prepared annually by the Assessment Equalization Board). Because of the complexities of the equalization process, equalized assessments for a given year reflect the actual assessment situation prevailing about two years previous.

It is generally accepted that the higher the proportion of Industrial and Commercial assessment in the tax base the better is the municipality able to sustain public services to its residents. The industrial and commercial tax base is measured by the proportion of the total tax base which is subject to the **School Foundation Fund Levy**. This measure is noted for the years 1988 and 1989.

Residential taxes are sensitive to changes in the total assessment base. A growing equalized assessment base brings the prospect of lower taxes, or better/more services for the same outlay. A shrinking assessment base means the likelihood of higher taxes simply to maintain the status quo, or cuts in the level and range of services to keep tax rates stable.

Changes in the equalized assessment are presented for two time periods: the past two years (1987-89); and the past year (1988-89). If you see major changes in the municipal assessment base, this may be due to annexations, or general re-assessments.

In this table you are provided with a broader municipal reference point for comparisons by using equalized mill rates rather than just the levels of taxation. These mill rate equivalents reflect the relative significance of the municipal and school taxes in relation to a municipality's property wealth base - their equalized assessment. For instance, you may determine that either of these taxes per dwelling unit is high compared to another municipality. If the corresponding equalized mill rate is also above the average, then you may conclude that the taxes truly are significantly higher than those in the municipality which is under comparison.

The **Municipal Taxation Equalized Mill Rate**, (M.T.E.M.R.) was generated by referencing the 1988 "Balance of Levies for Municipal Purposes". This was converted to a mill rate equivalent by using the total 1989 Equalized Assessment. You should note that this is an overall mill rate applied over all types of development by the municipality and is not exclusively residential in nature.

For a broader perspective, an **Supplementary School Requisition Equalized Mill Rate** (S.S.R.E.M.R.)has been computed using the total 1988 supplementary school requisitions for each municipality. This statistic represents an aggregate situation, embracing all supplementary school requisitions, by every supported jurisdiction, applied to all taxable properties.

A **School Foundation Program Fund and Other Requisitions Equalized Mill Rate** has been calculated for all the other requisitions which are levied against the equalized assessment tax base. Included are requisitions for the School Foundation Program, Hospitals, Planning, and Seniors Foundations. Again this mill rate is applicable to all taxable properties, not just residential.

The **Total Equalized Mill Rate** (T.E.M.R.) expresses the grand total of property taxes and grants-in-lieu levied, and received, by a municipality, as a mill rate based on total equalized assessment. It is a generalized total or aggregate rate, lumping together all types of property.

The **Residential Equalized Mill Rate** (R.E.M.R.) is a more specialized equalized mill rate dealing only with the residential and farmland properties in aggregate. Such property is often favoured by lower taxes. Businesses may be subjected to higher rates under a split mill rate situation, as well as having to pay the School Foundation Program Fund Levy. These higher tax rates are common because businesses can spread the burden over a larger group of people.

The equalized residential plus farmland mill rate is computed by isolating all taxes raised from residential and farm properties including mobile home licence fee revenue, and special property-assessment-based revenues. These taxes are expressed as an equalized mill rate by reference to that part of total equalized assessment which is not subject to the School Foundation Program Fund Levy.

TABLE III: THE EQUALIZED ASSESSMENT BASE AND ITS USE

USER'S GUIDE AND TECHNICAL NOTES

The Equaliized Assessment mix indicates the industrial/ commercial proportions of a municipaliy's tax base. Generally, the greater this percentage, the lower will be the residential taxes for the same "basket" of municipal goods and services.

Equalized Assessment trends can help you appreciate the taxation situation. A growing assessment base could mean lower taxes or the same service levels. A declining base may be accompanied by higher taxes and/or cuts in services.

Equalized mill rates give an indication of how heavily the property tax base is being used by the municipality, the Supplementary School Requisition and the School Foundation Program Fund and other requisitioning authorities. Generally, the greater the mills, the greater the demand on the tax base.

The equalized mill rates provide a broader municipal reference point for comparisons than in the case of levels of taxation.

The Index of Residential Equalized mill rates should be generally similar to the Total Property Tax index.

The industrial/ commercial portion of the equalized assessment, subject to the School Foundation Program Fund levy for 1989 and 1988.

Balance of levies for Municipal Purposes (AMFIS) divided by the Total Equalized Assessment for the municipality.

Total of all Supplementary Requisitions by all Requisitioning School Authorities divided by the Total Equalized Assessment for the municipality

Total of requisitions for the School Foundation Program Fund and taxes collected on behalf of regional and provincial authorities (eg. Alberta Planning Fund, auxiliary hospitals districts, nursing homes).

Total property taxes and grants in lieu of a municipality divided by its Total Equalized Assessment

Specialized mill rate for all taxes from residential (and farm) properties (including mobile home license fees) divided by the Total Residential (non-S.F.P.F.) Equalized Assessment.

TABLE IV: COMPARISON OF UTILITIES CHARGES, NET REVENUES

TABLE IV: COMPARISONS OF UTILITY CHARGES, NET REVENUE AND DEBT

Introduction

Utility charges comprise a significant portion of the direct costs to a residential property-owner. This is particularly the case for urban households.

Table IV features data for cities, towns and villages. Elsewhere, utility charges are of little or no significance or may vary widely depending upon the use of a number of local systems within a rural municipalities or summer villages.

Of all utility charges, Table IV recognizes those associated with **water supply, sewer service, and solid waste**. The combined influence of these utility charge is shown in **Utility Charges as a Percent of Total Aggregate Cost**. The comparative significance is brought out in an associated Index. The breakdown of Total Aggregate Costs, showing the influence of taxation, special levies as well as utility charges is seen on Table II.

The annual charges developed for each utility service are indicated in the table. Water and sewer charges were derived by applying the municipalities utility rates to a standard volume (360 cu.m.) of water consumption. This means that you can appreciate the differences in utility charges between municipalities.

Relatively few municipalities levy solid waste management service charges. Many recover these costs through general taxation. Where present, they are usually annual flat-rate charges. As a result, there may be cases of cross-subsidization. For example, sewer rates may be set relatively high to offset comparatively low water rates - or vice versa.

AMFIS data have been used to assist you in appreciating the diversity of enterprise financing practices among municipalities. The **Per Capita Net Operating Loss or Gain** associated with each function is indicated. If the self-financing principle was adhered to, all the statistics would be very close to zero.

You should note that the net operating financial circumstances can frequently change quite markedly from year-to-year. The AMFIS data presented is for 1988 (i.e. from the 1988 financial statements submitted by municipalities).

You should also note the potential for considerable interrelationship with the municipal tax component of the total property tax bill. Depending on whether a municipality chooses to run its water and sewer enterprises at a "loss" or a "gain", and on whether it chooses to establish a solid waste disposal charge, the burden of total aggregate costs could be shifted between taxation and utility service charges.

For example, a municipality may appear to have comparatively low taxation but high utility charges. This is likely due to a policy requiring utilities to be self-financing, thus avoiding any imposition on the general tax base. The reverse situation may also apply where the tax bill is "loaded up" to keep utility charges low (or non-existent with respect to solid waste management).

Ideally, revenues from utilities should contribute to the build-up of operating and capital reserves. These would deal with emergencies and fund major renovations or replacement of deteriorated systems. The debt service costs should be built into the rates charged but usually are not. High utility rates are often associated with high debt loads. Statistics on the **1988 Per Capita Debt Load** for water and sewer have been included in Table IV to assist you to appreciate the various municipal situations.

TABLE IV: COMPARISON OF UTILITIES CHARGES, NET REVENUES AND DEBT

USER'S GUIDE AND TECHNICAL NOTES

Compare the total annual utility charges for each service.

The standard measure (360 cu.m.) serves as a comparable measure among municipalities.

These columns indicate the significance of total utilities charges as a proportion of all the taxes and charges against a residential property. The index allows ready comparison with other similar municipalities.

If the self-financing principle was adhered to all statistics would be close to zero.

Negatives (-) mean that expenditures are greater than revenues. Positive values mean revenues are greater than expenditures.

High utility rates are often associated with high debt loads.

Compare the per capita totals for water and sewer services which a municipality is financing.

Municipality	Utilitiy Charges			Utility Charge Significance		Net Annual Costs			Utility Debt		
	Water (360 cu.m.)	Sewer (360 cu.m.)	Solid Waste	Percent of Total Aggregate Cost	Index of Percent of Total Aggregate Cost	1988 Net Operating Loss (-) or Gain Per Capita Water	Sewer	Solid Waste	1988 Debt Load Per Capita Water	Sewer	Solid Waste
SUMMARY OF AVERAGES											
CITIES	$329	$131	$24	32%	100.0	$9	$2	($12)	$250	$152	$3
TOWNS	$276	$112	$47	31%	100.0	$1	($1)	($10)	$274	$176	$1
VILLAGES	$221	$89	$31	32%	100.0	($22)	($13)	($13)	$309	$200	$0

Municipal utility rates are applied to a standard volume of 360 cu.meters per year.

Annual utility charges for water, sewer and solid waste combined as a percentage of Total Aggregate Cost. (Table II)

Annual operating revenues less expenses divided by municipal population. These financial circumstances can change markedly from year to year.

The total debt in 1988 associated with each function is divided by the population. These financial circumstances can change markedly from year to year.

APPENDIX 1: RURAL MUNICPAL TAXATION DETAIL, FISCAL CAPACITY AND ASSESSMENT MIX

APPENDIX 1: RURAL MUNICIPALITIES: TAXATION DETAIL, FISCAL CAPACITY AND ASSESSMENT MIX

Introduction

The appendix is organized on the basis of Alberta Agriculture's six regions. The costs of conducting government in a rural setting are affected by local geography and climate, and proximity to comparable communities should be considered carefully.

The consideration of average taxation per dwelling in rural municipalities is subject to wide ranging possibilities for misinterpretation. Dwellings in a rural municipality may include country residential developments, urban housing in hamlets and one or more dwellings per farm unit. Unfortunately, from available published data it is not possible to specifically determine how many of each type of dwelling there are in a rural municipality. Neither is it possible to accurately separate country residential taxation data from hamlet residential data. The data sets provided in this table are intended to help you to select the best rural municipalities for comparisons.

The two **Density Statistics** will assist you in your comparative analyses. The first is population per square kilometer. In the case of the road length per square kilometer, the reference is to local and secondary roads where the rural municipality has some or all the servicing responsibility. (It does not include any primary or forestry roads, nor any roads classed "not open.")

The **Number of Farms** data comes from Alberta Agriculture's "1986 Alberta Census of Agriculture". These statistics, in conjunction with other information on the total number of dwellings (from Alberta Municipal Affairs records), have been used to derive a crude estimate of **"Non-Farm Dwellings"** based on an assumption of one dwelling per farm. In some areas, such as those with large Hutterite settlements, this clearly can overestimate the number of non-farm dwellings. These data have permitted the estimation of approximate comparative taxation levels for the average farm and the average non-farm.

Property Tax per Farm has been estimated from 1987 AMFIS information on the taxes raised from "farmland" properties, divided by the number of census farms. The "non-farm" statistic recognizes taxes raised from "residential" properties as well as any special assessments and mobile home licence fee revenue. These "taxes" were divided by the estimate of non-farm dwelling units. Apart from the crudeness of the latter estimates, the value of the unit statistics is heavily dependent on the accurate reporting of the breakdown of property taxes in Schedule FS5 of the Alberta Municipal Affairs financial statements for municipalities. Both sets of unit taxation are complemented with average index statistics, referenced to the relevant agricultural region average. These permit an at-a-glance relative positioning of individual municipalities.

The fiscal capacity statistics furnish you with the means to begin to explain the differences observed in the unit taxation data. **Equalized Assessment per Road Kilometer** is of particular significance for rural municipalities because of the importance of the road maintenance/construction function (often accounting for around two-thirds of total operating expenditures).

You can gain an appreciation of the quality of the average farm from the measure **"Farmland Equalized Assessment per Farm"**. Similarly, the quality of the average non-farm residence is indicated by the measure of **"Non-Farm Residential Equalized Assessment per Non-Farm Residence"**. Relatively high levels of fiscal capacity indicated by any of these three measures will signify to you the likelihood of high service level expectations and high tax rate tolerances, and vice versa.

You can quickly obtain a useful profile of each rural municipality by reference to the equalized assessment composition statistics. Fundamental differences are readily apparent in the contrasting significance of Farmland, Non-Farm Residential development, and non-residential (industrial/E.P.P.L/ machinery and equipment/corporate farms) assessment. The rural municipalities with the greatest fiscal capacity are those with an above average percentage of non-residential assessment to share their tax burden. More complex situations to understand are created where there are high levels of non-farm residential development (e.g. acreages, country estates, hobby farms).

Rural municipalities with farmland dominating their assessment base are now the exception rather than the rule. However, most continue to exert a strong farmland dominance over non-farm residential development, and some also have high levels of non-residential assessment.

APPENDIX 1: RURAL MUNICIPALITIES: TAXATION DETAIL, FISCAL CAPACITY AND ASSESSMENT MIX

USER'S GUIDE AND TECHNICAL NOTES

Compare these characteristics with other rural municpalities within and between regions. Lower density population will tend to be more costly to serve.

Compare farm and non-farm annual property taxes using the totals and the indices.

Compare these fiscal capacities with the region's average.

High levels of fiscal capacity by any of these measures signify the likelihood of high serve level expectations.

The municipalities with the greatest fiscal capacity will have a high percentage of SFPF equalized assessment to share their tax burden.

Compare the levels of non-farm and farm residential developments and contrast it with the farmland dominance.

	Density Characteristics		Farms/Non-Farms		1988 Property Taxation Unit Averages				Fiscal Capaxities			Equalized Assessment Composition

Alberta Agriculture's six Census Regions

The municipal population (Alberta Municipal Affairs Oct 89) divided by the area of the municipality (AMFIS)

Roads refers to all open local and secondary roads for which a municipality has responsibility. Does not include primary and forestry roads.

Number of Farms reported in Alberta Agriculture's 1986 Census of Farms.

Those dwellings not related to a farm such as country residential, hamlets and summer resorts. This estimate is made by subtracting the number of farms from the total number of dwellings.

Taxes from farmland properties in a municipality divided by the number of farms.

Taxes from residential properties and mobile home license fees divided by the estimated non-farm dwellings.

Road construction and maintenance is a significant expenditure for rural municipalities. Equalized assessment is the base on which taxes, to recover the net costs, have to be levied. Disproportionately large averages are reflective of the impact of I.D.'s with large tax bases but little road length to maintain.

Indicates the comparative value of farm and non-farm residential property.

Refer to the Introduction of the Appendix for details.

This is the industrial and commercial portion (industrial, E.P.& P.L., machinery and equipment, corporate farm) of the assessment.

APPENDIX 1: RURAL MUNICIPALITIES: TAXATION DETAIL, FISCAL CAPACITY AND ASSESSMENT MIX

APPENDIX 2: SCHOOL JURISDICTIONS COMPARATIVE CONTEXT DATA

APPENDIX 2: SELECTED SCHOOL JURISDICTIONS: COMPARATIVE CONTEXT DATA

Introduction

In this Appendix, a range of school jurisdiction data helps you to gain a greater appreciation of the variations in supplementary school taxes indicated in Table II. Table II shows the school taxation burden being placed on a particular municipality by the combined supplementary requisitioning requirements of all the school jurisdictions supported by that municipality. Appendix 2 details the scale of operations, resource base and fiscal capacity of the individual school jurisdictions. The data presented have been obtained from Finance and Support Services, Alberta Education.

This Appendix includes information on all operating and non-operating school jurisdictions. Non-operating school jurisdictions are active for taxation purposes but do not operate their own schools. These districts send their students to the nearest operating jurisdiction. Blank spaces in the expenditure columns denote non-operating school jurisdictions.

The **school jurisdiction designation (zone, code, name, and number)** identifies the location and status of each school district. The coded identification is detailed in the School Jurisdiction section of the User's Guide. Refer to this section as well in order to identify the predominant school system in each municipality.

The scale of each jurisdiction may be appreciated by reference to the information on the **Resident Pupil Count, the Adjusted Equalized Assessment**, and **Total Operating Expenditures**.

The **Adjusted Equalized Assessment** data are for the purposes of education finance. It reflects an adjustment for the **Electric Power and Pipe-Line** (E.P.P.L.) assessment within the rural municipality parts of a school jurisdiction. The Adjusted Equalized Assessment includes an allocation of the E.P.P.L. assessment among the school jurisdictions that are operating within a rural municipality. To the extent that E.P.P.L. assessment is present, all supporters of the particular jurisdiction are better off. The **Adjusted Equalized Assessment** is the sum of the actual equalized assessment, contributed by each supporting municipality, and an imputed equalized assessment value based on the application of the net mill rate to the E.P.P.L. tax contributed by the rural municipalities. The formula is as follows:

Adjusted Equalized Assessment = Actual Eq. Ass. + [(E.P.P.L. Tax / Net Mill Rate) x 1000].

The significance of the E.P.P.L. factor is brought out in the statistic showing the **Adjusted Equalized Assessment as a Percentage of the Actual Equalized Assessment.**

The fiscal capacity of each jurisdiction is indicated in terms of Adjusted Equalized Assessment per Resident Pupil. This will have a strong bearing on the amount of supplementary requisition established by a school authority. Those with a strong fiscal capacity are in a position to make a comparatively large requisition in per pupil terms. Those with a weak capacity (e.g. below average) do not have this option unless they are prepared to set a very high school tax rate. However, some flexibility may be available depending on the

significance of the E.P.P.L. contribution.

Appendix 2 also includes comparative data on the percentage of the total requisition covered by E.P.P.L. Other comparative statistics include the level of **Supplementary Requisitions per Resident Pupil** served, and the **Net Mill Rate**. The latter is probably the best single comparative indicator of the school tax burden for residential property-owners.

The Net Mill Rate is computed as follows:

Net Mill Rate = [(Supp Req. P E.P.P.L. Tax) / (Actual Eq. Ass.)] x 1000.

To round out the picture, information is presented on **Operating Expenditures** by each school jurisdiction (1986/87 data). The statistics show you both the level of **Expenditure per Enrolled Pupil**, and this **expenditure in relation to the adjusted equalized assessment**. Much of the expenditure is covered by provincial grants designed to ensure at least a foundation level of education for each pupil regardless of the jurisdiction. There is, therefore, comparatively little variability in per pupil expenditures. However, because of the wide range in fiscal capacity, the expenditure effort statistics do vary considerably.

APPENDIX 2: SCHOOL JURISDICTIONS: COMPARATIVE CONTEXT DATA

As referenced in the User's Guide, select the school authority using it zone, code, name and number.

The scale of each jurisdiction is gained from this number and the total operating expenditure.

Adjusted Equalized Assessment includes an allocation of E.P. & P.L. assessment among school jurisdictions operating within a rural municipality.

The significance of the E.P. & P.L. factor is brought out in the Adj. E.A. as a percent of the actual E.A.

The higher the Adjusted E.A. per resident pupil the greater is the capacity to bear the supplementary school requisition.

Compare the totals and the statistics to appreciate the level of expenditures and the related expenditure effort.

			Pupils	Adjusted Equalized Assessment			1988 (Adj.) Eq. Assessment Supplementary School Requisition			1987/88 Operating Expenditures		
Zone	Code	Name and Number	1988/89 Resident Pupils	Adjusted Equalized Assessment	Adjusted E.A. % of Actual E.A.	Adusted E.A./Res. Pupil	EP & PL Portion	Per Res. Pupil	Net Mill Rate	Total Operating Expenditure	Per.Exp. Per Enrolled Pupil	Exp.Effort (Exp.per $1,000 Adj. E.A.)

For explanation of School Jurisdiction Code see User's Guide.

The Equalized Assessment is adjusted to include the electric power and pipeline (EP & PL) portion.

By including EP & PL this total is greater than Total Equalized Assessment.

A fiscal capacity indicator is derived by dividing the Adj.E.A. by the resident pupils.

Net Mill Rate = (Supplementary Requisition - EP & PL tax / Actual E.A. * 1000)
